

As part of the November MSU Network Administrators Group meeting
NetScreen and AmeriNet will be presenting:

Firewalls: The protection you need at the performance level you demand.

NetScreen will be discussing how firewalls provide the protection you need at the performance levels you require, ensuring that your network security enables your success. Firewalls stop unauthorized users from accessing your network resources, providing the first layer of security to protect critical business assets. With solutions that can be deployed across your network from the perimeter to the infrastructure, firewalls help you isolate network segments to further protect sensitive resources from both internal and external attacks.
